EDUCATION

Georgia Institute of Technology

May 2028

B.S in Computer Engineering

Atlanta, GA

- Cumulative GPA: 4.0
- Relevant Coursework: Linear Algebra, Calculus III, Ordinary Differential Equations, Physics I and II, Data Structures and Algorithms, Circuit Analysis, Low Level Programming

TECHNICAL SKILLS

Languages: Java, Python, Rust, C, C++, SQL, JavaScript, HTML/CSS, R, MatLab, $\text{\LaTeX}$, Bash, Arduino, RISC-V
Engineering Focus: Control Systems, Sensor Fusion, Embedded Systems, Systems Engineering, Aerospace Systems
Proficiencies: Microsoft 365, Data Analytics, Modeling & Simulation, Management, Teaching, Spanish (Intermediate)
Interests: Machine Learning, Optics, Artificial Intelligence, Cryptography, Cybersecurity, Algorithms

EXPERIENCE

Software Engineer

May. 2026 – Present

Transpira Labs (Backed by Christopher Klaus)

Atlanta, GA

- Directed operations for a training-data platform supporting 40+ expert contractors, developing domain-specific pipelines used to generate high-quality training signal for frontier AI systems.
- Built and deployed supply-chain evaluation environments across NeMo Gym, τ^2 Bench, and Hud, benchmarking frontier and open-source models and establishing baseline performance across production-oriented planning tasks.

Software Engineer

Sep. 2025 – Apr. 2026

Nuntius (YC S'25)

Remote

- Designed and implemented custom data-based environments with synthetic data generation, automatic evaluation, and a custom reward system to quantify LLM model alignment in tool-based systems.
- Conducted penetration testing and failure analysis on AI models, uncovering security weaknesses and edge cases that informed model hardening strategies.

Propulsive Landers

Jan. 2026 – Present

Guidance, Navigation, and Control — Python, Rust

Atlanta, GA

- Developed control systems simulations for autonomous flight, implementing servo command scheduling to simulate time-dependent actuation in flight
- Implemented real-time sensor fusion using an Extended Kalman Filter and dynamic state transitions for estimation under noisy sensor conditions

PROJECTS

Mathworks Math Modeling (M3) Champion | *Python, R*

Mar. 2025 – May 2025

- Developed mathematical models to predict energy demand in Memphis in 2025 and 2045; validated models with real-world data using Python and SciPy
- Built multiple linear regression models with backward variable selection to quantify vulnerability, guiding targeted resource allocation based on statistical and socioeconomic indicators
- Presented findings live to Ph.D mathematicians; Published in the SIAM Undergraduate Research Online journal
- Placed 1st out of 794 teams internationally in the US and UK; Awarded \$20,000 grand prize; Published in SIURO

Subtask Evaluation Framework | *Python*

Jan. 2026 – Present

- Designed and implemented a modular Python evaluation framework extending τ -bench, supporting configurable weighted scoring, penalty systems, and hybrid LLM/deterministic grading across multi-step agent workflows
- Evaluated frontier model performance (claude-opus-4-6) across long-horizon tasks, producing granular subtask-level diagnostics that surfaced failure modes invisible to traditional binary pass/fail metrics

Science Olympiad Codebusters | *TypeScript, Web Development*

Aug. 2025 – Present

- Engineered enhancements to the Science Olympiad Codebusters [website](#), building educational and competition-management tools that supported nationwide cryptography training and exam administration.
- Member of the Science Olympiad Codebusters national committee; designed official competition rules used by 10,000+ students, administered exams serving 1,000+ students across state and national competitions.
